# Introduction

This document presents the main information, conclusions, and results obtained during the process of defining the company's costs and revenues, considering cash flow, in addition to the development of the landing page.

Defining costs and revenues for cash flow analysis allowed us to understand where money will be allocated over the years and how the company will profit. In addition, it personally helped me learn about a topic I had no knowledge of. The landing page, on the other hand, brought our company to life, especially considering the changes implemented since the mockup was produced.

## Finances

### Costs

Defining costs was one of the most important topics, since everything else depended on it. I created a spreadsheet with estimated fixed costs per month, and based on the final amount, I arrived at an hourly rate, which would be what I would charge clients. Talking to some colleagues, I realized that I couldn't charge by the hour for all cases, as for some the price would be too high, so I had the idea of offering packages. Unfortunately, I didn't have much time to develop this idea, and to facilitate revenue and cash flow projections, I stuck with the idea of charging by the hour.

This does not mean that I will not improve the idea in the future, but at that moment, the exercise and exposure to new concepts was more important than ensuring reality.

### Revenue assumptions

With the hourly rate to be charged, it was possible to estimate revenue for the next 5 years starting in 2026. The idea was to create a pessimistic and an optimistic scenario.

The calculation was based on multiplying the hourly rate by the number of hours worked, which increased according to demand.

## Pessimistic

In the pessimistic scenario, 117.6 hours of work were considered for the first 3 years, as the remaining 30% of 168 hours are allocated to travel, internal meetings, meetings with potential clients, and other activities.

The basic strategy for projecting the percentage of hours worked over time was: after 3 months – 20%, 6 months – 40%, 12 months – 60%, 24 months – 80%, and 48 months – 100%. This is because we will not be conducting any marketing activities and growth will depend solely on referrals, so it will take at least 2 years to reach the total workload of 117.6 hours per month. As mentioned, this strategy was used as a basis, and in the case of my company, we achieved 100% in the third year.

In the last two years, the number of hours has increased to 235.2, as with the increase in demand, employees will start working collectively and individually until they reach 100% of individual work. As a result, in 2029, the year ended with 75% of hours used, and in December 2030, it reached the 100% mark.

## Optimistic

In the optimistic scenario, 117.6 hours of work are considered for two and a half years, with the same justification as in the pessimistic scenario.

The strategy adopted in the projections considered a six-month advance in demand. This approach is based on an optimistic perspective, assuming that growth may occur earlier than expected, about half a year in advance, which represents a realistic estimate, without exaggeration either way.

From mid-2028 to 2030, the number of hours increases to 235.2, and considering the six-month advance, this scenario reaches the milestone of 75% of hours worked in July 2029 and 100% in August 2030.

## Discounted cash flow

With a view to calculating revenue and costs, it was possible to perform cash flow projections for five years. This process was important in terms of learning, as I noticed that I had made some accounting errors in the other reports and had to go back and fix them.

For costs, the amount increased proportionally to the company's growth. The main increases involved more office hours for meetings, the acquisition of new tools, certifications to prove our knowledge, and salary increases and promotions. The revenue amount, on the other hand, was based entirely on revenue assumptions.

Overall, the company's first two years closed with negative cash flow, since opportunity cost is being taken into account, and the following three years are already starting to show a profit.

## Market expansion strategy

Even if no known marketing actions are taken, such as social media posts, advertisements, and videos to convince the public, we need to create strategies that guide our only form of expansion: word of mouth.

In this sense, three strategies were devised. The first is indication and network effect, that is, we hope that our customers will in the future take our work as a reference and refer it to close friends who need help, and they will refer it to more friends, forming a network effect. The others, for reasons of strategy and privacy, cannot be mentioned here.

Our intention with these strategies is to expand our service in an organic and private way.

## Landing page

The entire website was developed at IA Lovable, and there were two versions in total. The first version was faithful to the mockup, but at the end of development, I realized that it lacked personality and contained too much text, which was tiring for the user. In this same version, some changes were made to spread the text out so that it didn't seem so overwhelming, but I wasn't very successful, and the website still looked more like a portfolio than a service sales page.

So, considering that there was no time to make a new mockup, I looked for inspiration that matched the personality I wanted and developed the new version based on that. The main changes revolve around the same fact: how to use elements that complement the text so that it is not tiring for the user.

Below is an example of the difference between the presentation of two of our services. The texts have been hidden for privacy reasons, as the website has not yet been published, but it is possible to understand the amount of text before and its division after.

Services

Criminal Investigation

Image 2 - Final version of the website services

Even though the amount of text is the same in both cases, simply rearranging the location of the elements gave the site a different and less tiring feel.

In the end, I managed to come up with a version with much more personality that sounded like a service sales website rather than a presentation website. Unfortunately, there are still some minor modifications to be made, both in terms of design and code quality, so the access link will not be made available.

## Conclusion

This period of the project taught me many new things. I was extremely challenged by topics involving finance, as I had never dealt with this before. Learning everything from scratch was very important, because along the way I realized that I had made many mistakes, and it was important to learn from them and correct them.

In addition, creating the website was also an important part of the project and brought the company to life. Getting it wrong the first time was also important in realizing what I shouldn't do and how I would have to change the design to achieve the goal I wanted.
